Close-to-global harmonization in 700 MHz based on APT-700 band plan / 3GPP Band 28

Now including CEPT with options to use duplex gap and guard

- ECC decision drafted for 2x 30 MHz lower duplexer of Band 28 with -48 dBm/8 MHz out of band emission requirement
- The duplex gap may be used for Supplemental Downlink, PMSE or PPDR

700 MHz Band 28 availability globally

In operation in AUS and NZ, supported by upper end of recent device range

700 MHz band awards Brazil in Aug 2018 and Honduras in Sep 2018

Finland and Sweden ("the usual suspects") announced availability in 2017

France considering an auction 2015, band availability in uncertain

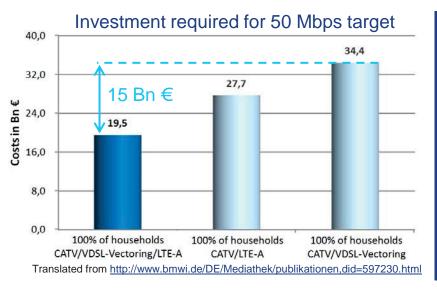

Germany plans auction 1H15 with nationwide availability 2H19 (only after completion of DVB-T2 migration) targeting regional availability before E2018 to prove progress on national 50 Mbps broadband target 2018

For UK, OFCOM stated "not before 2018" initially, 2022 or earlier in current OFCOM strategy

EU High Level Group report of Pascal Lamy to the European Commission on UHF proposes 2020 +/-2 years for EU, echoed recently in RSPG opinion draft under consultation

15 Bn € cost saving opportunity on the investment required for the German broadband targets by including LTE-A Carrier Aggregation and 700 MHz

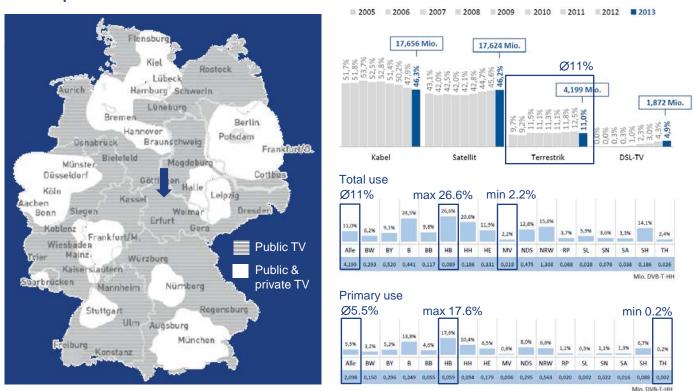

Threats:

Late clearing from DTT delays broadband target achievement

- ⊗ German DVB-T2 migration until 1H19
- Exclusive spectrum demand of PPDR in 700 MHz would block large parts of the band
- © all 2x 30 MHz in German auction
- TÜV Study: a mix of all technologies is required to cost-efficiently achieve 100% target of 50 Mbps by 2018
- To transport 50 Mbps over several km, sufficient bandwidth below 1 GHz is required
 This can be provided in combined 800 MHz and 700 MHz frequency resources technically addressed with LTE Carrier Aggregation

In the state of Thüringen, 2000 households prevent 320 MHz of prime UHF spectrum from possible use for Mobile Broadband

In Germany, an average of 11% households uses DVB-T as a source for TV, 5.5% depend on DVB-T

DVB-T use ranges between 2.2% and 26% subject to private TV offer

Between 0.2% and 17.6% of the households rely on DVB-T exclusively

Supplemental Downlink (SDL) - A flexible way to introduce Mobile Broadband in the UHF band where no additional bands can be cleared for FDD any time soon

SDL is downlink only and thus well compatible with DTT, even within Geneva-06 agreements SDL allows for harmonised wide band RX devices to address scattered spectrum in 470-694 MHz SDL adds DL capacity to Mobile Broadband networks via LTE-A carrier aggregation Within SDL, eMBMS can be used to efficiently carry linear traffic, based on market demand

Vision 2020+: mobile allocation in 470-698 MHz and Supplemental Downlink for ubiquitous video and TV across the full device range

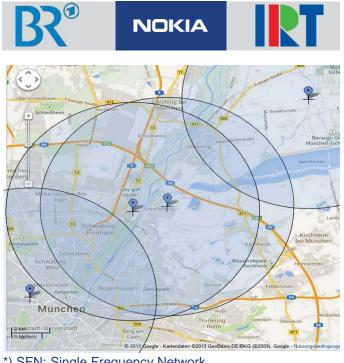

Wide choice of linear live TV programs and individual non-linear offering consistently across multiple device types

Full Mobility: at home not only in the living room, at the station, on the train, even underground, in the car ...

Fully interactive capabilities e.g. active participation in shows

First successful field trial in Germany

Implemented with commercially available Flexi eNodeB hardware

Q2/14: Field trial Prototype with SFN* available

Q4/14: Demo center Available for customer visits

Configuration

- > eMBMS and SFN* on Nokia Flexi Multiradio 10 BTS
- > Core network emulation
- > 4 cells in SFN* operation, 4 locations, QC terminals
- > UHF spectrum, band 28, to analyze coverage conditions
- > 10 MHz (several SD channels, some HD channels)

*) SFN: Single Frequency Network

L-Band Licensed Shared Access 2.3 and 3.5 GHz LTE-U 5G

Vision

Technologies

Timelines

Spectrum

"L-Band" 1452-1492 MHz for Supplemental Downlink (SDL)

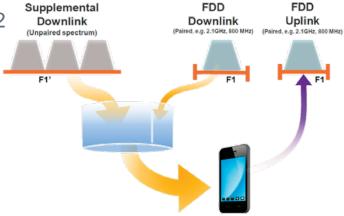

Technically

- CEPT report 188
- 3GPP Band 32, CA band combination 20 (EU800)+32
- Qualcomm 9x30 chipset support since Oct 2014

Spectrum availability

- UK in L-Band owned by Qualcomm
- Italy planning auction in 2015
- France rumoured to plan auction in 2015
- Germany part of proposed auction 1H15

Opportunity: substantial DL capacity upgrade at moderate (?) spectrum cost Challenge: site upgrade cost (antennas, feeding systems, mast loads, ...)

Harmonization and global standards drive economies of scale

Spectrum usage models

Mainstream Approach Auctions of Cleared Spectrum

Exclusive Use
Ensures
Quality of Service

Complementary
License Model
Licensed Shared Access

Exclusive Shared Use

Exclusive use on a shared and binary basis in Time, Location, and/or Frequency with Incumbent (government, defense etc.)

Predictable Quality of Service

Shared Approach Unlicensed (Wi-Fi, LTE-U, ...)

Shared Use Unpredictable Quality of Service

Wi-Fi has simple in-built autonomous rules w/o central control

Heavy traffic requires management of the scarce resource

Wi-Fi uses carrier sense multiple access with collision avoidance (CSMA/CA), c.f. "roundabout rules"

- works fine for limited #users, moderate load
- prone to blocking at high number #users, high loads unpredictable impact of other Wi-Fi and other services in unlicensed band
- → good performance at low load, zero throughput at extreme load

Cellular uses network controlled scheduling to assign resources to users according to their demand, c.f. "intelligent traffic lights"

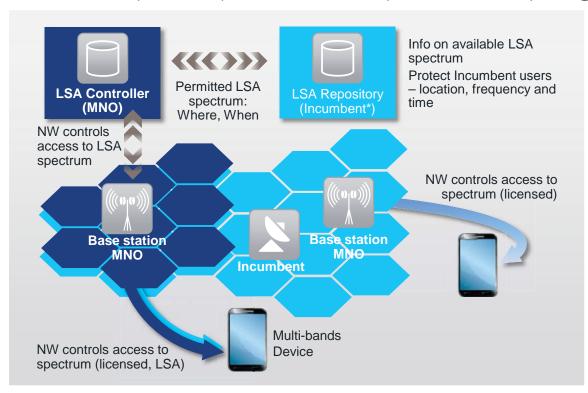

- works fine for any #users at any load even if data rate needs to be shared among users
- good performance at low load, predictable and best possible performance at high load

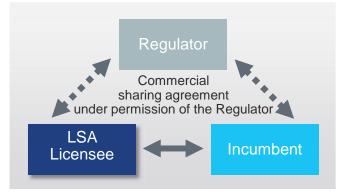

A new way of licensing mobile broadband spectrum - Licensed Shared Access (LSA)

LSA is a simple concept which can be implemented today using available terminals and network

Regulatory framework

- LSA spectrum to be licensed is identified by the government
- Subject to a private commercial agreement between incumbent and LSA licensee

Licensed Shared Access, or Authorized Shared Access (ASA)

Unlock more spectrum e.g. in 2.3 GHz with predictable QoS

Our approach · Enables timely availability and licensed use of harmonized spectrum with predictable QoS License holder 3.8 GHz ASA controller ASA repository Licensed 3.6 GHz _icensed Toulous 2.1 GHz

Operator benefits

- Accelerates spectrum harmonization
- Leverages available LTE technologies to ensure early use and Economy of Scale
- Opportunity for lower cost and high quality licensed spectrum

Innovation examples

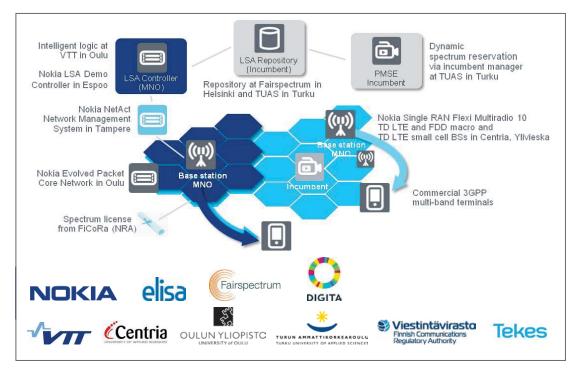

World 1st LSA over the air field trials proved the concept

LSA TD LTE 2300 with PMSE over the air field trial with e2e Finnish ecosystem

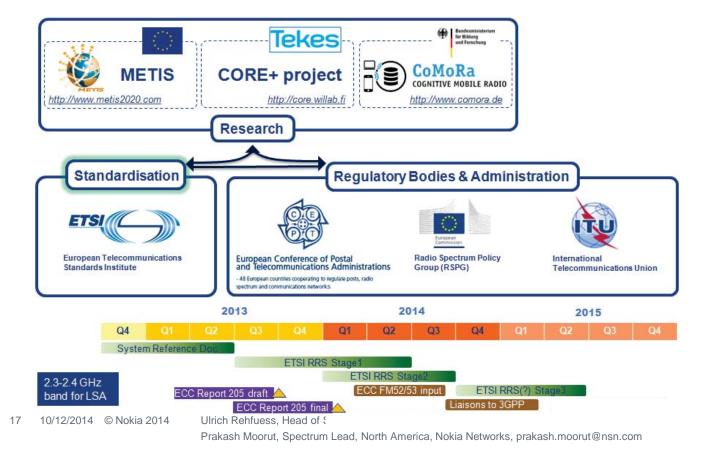

Trial included full e2e LSA ecosystem in Finland: regulator, incumbents, MNO and supplying industry in CORE+ project

LSA Ecosystem

LSA is progressing on all levels in Europe

Nokia in Research - Standardization - Regulatory Bodies and Administration

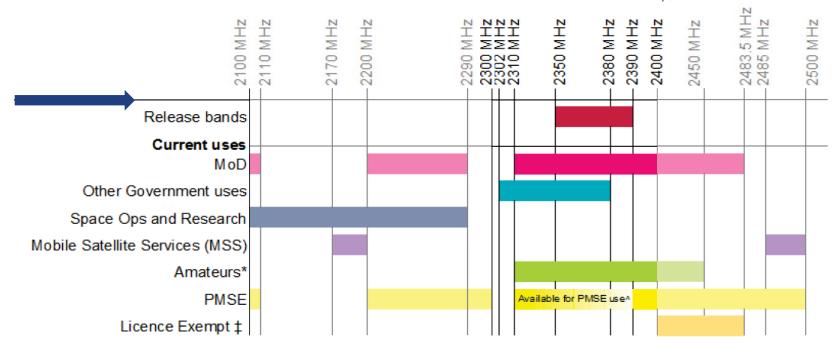

NOKIA

UK first in EU to release 2.3 GHz increasing momentum in the region

UK 2.3 GHz band use - 40 MHz (2350-2390 MHz) to be auctioned exclusively, Band 40

^{* 2400} to 2450 MHz may also be used by the amateur satellite service

Source: http://stakeholders.ofcom.org.uk/consultations/pssr-2014/

10/12/2014 © Nokia 2014

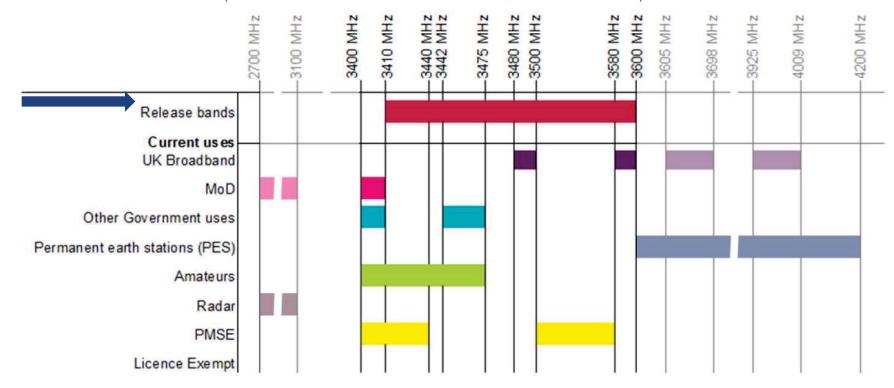

^{‡ 2400} to 2500 MHz is designated for Industrial, Scientific and Medical (ISM) applications

[^] The band 2300 to 2390 MHz is used by PMSE on a loan basis agreed with MoD and other government departments

UK to release additional spectrum in 3.5 GHz

UK 3.4 GHz band use - up to 150 MHz in 3410-3600 MHz, Band 42 TDD preferred

Source: http://stakeholders.ofcom.org.uk/consultations/pssr-2014/

Use of unpaired bands for downlink, e.g. in 2.6 GHz

Supplemental Downlink vs. up to 100% downlink via LTE-A Carrier Aggregation

Supplemental Downlink (SDL)

- Requested by some global operators to optimally use unpaired bands like the 2.6 GHz in DL direction only
- Inline with earlier ideas of using e.g. 2.6 GHz unpaired band as external DL band
- Could split the device ecosystem into devices supporting TDD in the band, others supporting SDL and a third fraction supporting both
- Typically considered as FDD and consequently objected by major TDD players

Flexibility in TDD up to 100% DL

- Like SDL, requires another (FDD or TDD) band as primary component carrier for LTE-A Carrier Aggregation
- Technically (from a spectrum analyser's perspective) similar result like SDL
- "wastes" UE TX capability in 100% DL use case (marginal cost drawback)
- Maintains a common ecosystem
- Even pushes TDD support as default into devices, as iPhone 6 could have
 2 variants (FDD+TDD, FDD+TDD+CDMA) in stead of 3 variants (FDD, FDD+CDMA, FDD+CDMA+TDD) with TDD only supported in the highest tier

20 bands supported in Apple iPhone 6 & 6 Plus at European operators

United States Appalachian Wireless iPhone 6 1 (2100 MHz) Model A1586 (GSM) Bluegrass Cellular 2 (1900 MHz) Model A1586 (CDMA) Boost 3 (1800 MHz) C Spire 4 (AWS) iPhone 6 Plus 5 (850 MHz) Cellcom Model A1524 (GSM) 7 (2600 MHz) Chariton Valley Model A1524 (CDMA) Chat Mobility 8 (900 MHz) 13 (700c MHz) Defense Mobile 17 (700b MHz) MobileNation Nex-Tech 18 (800 MHz) 19 (800 MHz) NorthwestCell nTelos 20 (800 DD) Pioneer Cellular 25 (1900 MHz) 26 (800 MHz) Sprint STRATA Networks 28 (700 APT MHz) Syringa 29 (700 de MHz) 38 (TD 2600) Thumb Cellular 39 (TD 1900) **United Wireless** 40 (TD 2300) US Cellular 41 (TD 2500) Australia Optus (including Virgin) Telstra Vodafone Germany Deutsche Telekom 02 Vodafone

LTE for Unlicensed Bands (aka LTE-U) - Licensed-Assisted Access using LTE

Standalone use or - as an early implementation - with downlink carrier aggregation

- Unique combination of licensed + unlicensed bands
- Licensed band provides reliable connection and quality of service for mobility, signaling, voice and data
- Unlicensed band boosts data rates "Opportunistic use"
- LTE-U to be integrated into small cells beside Wi-Fi
- Downlink:uplink asymmetry up to 10:1 in LTE networks
- Targets public hotspots managed by operators

E1E0	200 MHz	. E4	255 MHz	125 MHz	E0E0

Spectrum

5G will expand the human possibilities of the connect world

5G technologies under study

Spectrum access and efficiency

Massive MIMO and massive beam forming

3...6 GHz: Spectral efficiency (MIMO),

>> 6 GHz more about path gain (BF)

Centimeter-Wave and Millimeter-Wave

Spectrum access, for dense deployments

New waveforms and modulations

Must be justified by gains, compatibility with MIMO essential

5G reserarch

Multi-RAT integration

5G is integrating novel and existing radio access technologies

Radio virtualization

Parts of radio will be virtualized, need for specialized L1 HW may still persist Flexible networking

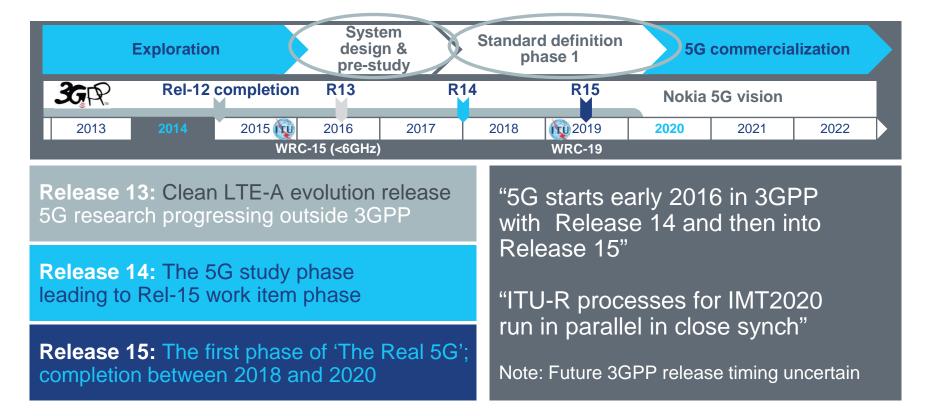

Local gateway/services
Per-service tailored
feature set (mobility,
QoS, latency etc.)

Reliability – Flexibility – Scalability

NOKIA

Deployment

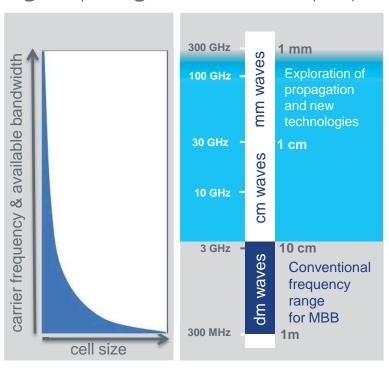

5G from research to standards

Bridging the spectrum gap to deliver extreme capacity in 5G

High hope, high risk: additionally exploring frequencies above 6 GHz

Opportunities

- Very wide and contiguous band widths
- Extreme capacity
- Lean Air interface

Challenges

- Physical propagation characteristics Close-to-optical propagation does no allow for non-line-of-sight connections
- RF components Antennas, Power Amplifiers, Transceivers ...
- Identification of suitable wide contiguous frequency bands in the cm and mm wave range

Some 5G Spectrum & Regulatory Updates

Initiate a new round of Detailed Spectrum Investigation (DSI) for above 6GHz in CEPT

- Industry would like to get IMT spectrum for 5G in WRC2019.
- Need information about current usage and incumbents' future plans, not just allocation.

CEPT activities towards WRC2015 Al10 ECC (PT1 & CPG PTA)

- In ECC PT1 a working document exists to collect response to PTA liaison to PT1 on >6GHz spectrum
- 1st draft by January 2015 and final draft by April 2015

Assessment of frequency ranges / bands 6 – 100 GHz

Bands having a worldwide (co)primary allocation to Mobile Service have most potential for spectrum designation

Not all bands with (co)primary allocation to Mobile Service may be suitable for IMT designation Therefore, detailed studies are needed to assess the suitability

Current use

Actual usage (not just allocation) of the frequency ranges should be further investigated

Channel bandwidth

Regulator-assigned channel bandwidths need to be assessed

Footnotes

ITU RR and ECA Table footnotes should be examined to find out restrictions and prohibitions

Contiguous spectrum

E.g. minimum 300 MHz of contiguous spectrum needed for a band to be suitable

Interference

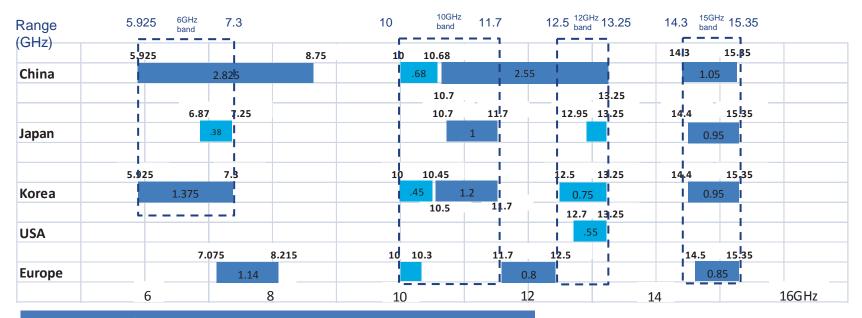

Situation and/or probability of interference should be considered

Channel characteristics

Channel/path loss model needs to be studied.

6-16GHz, Co-Primary Mobile Allocation, min. 300MHz Contiguous Spectrum

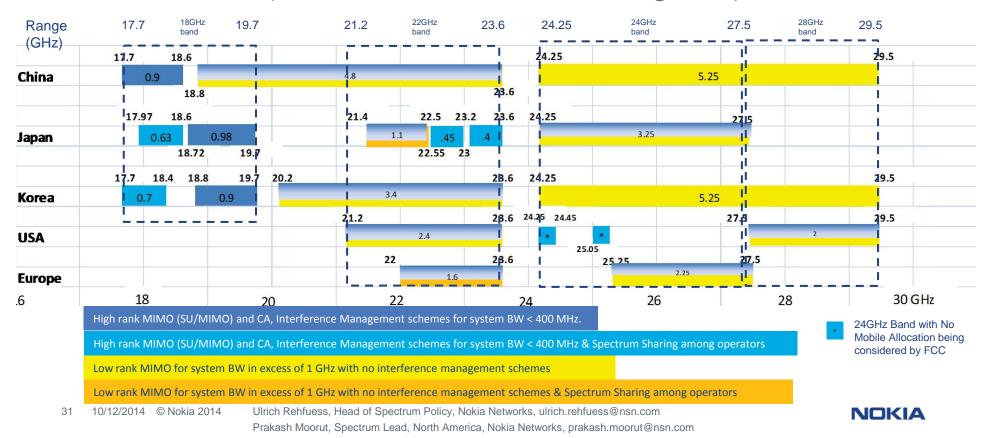

High rank MIMO (SU/MIMO) and CA, Interference Management schemes for system BW < 400 MHz.

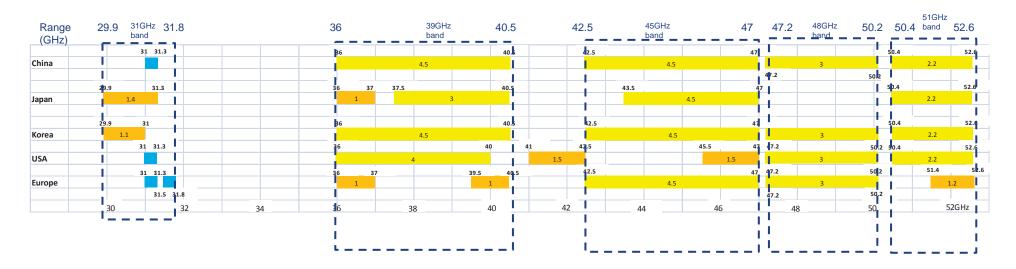

High rank MIMO (SU/MIMO) and CA, Interference Management schemes for system BW < 400 MHz & Spectrum Sharing among operators

16-30GHz, Co-Primary Mobile Allocation, min. 300MHz Contiguous Spectrum

30-54GHz, Co-Primary Mobile Allocation, min. 300MHz Contiguous Spectrum

High rank MIMO (SU/MIMO) and CA, Interference Management schemes for system BW < 400 MHz.

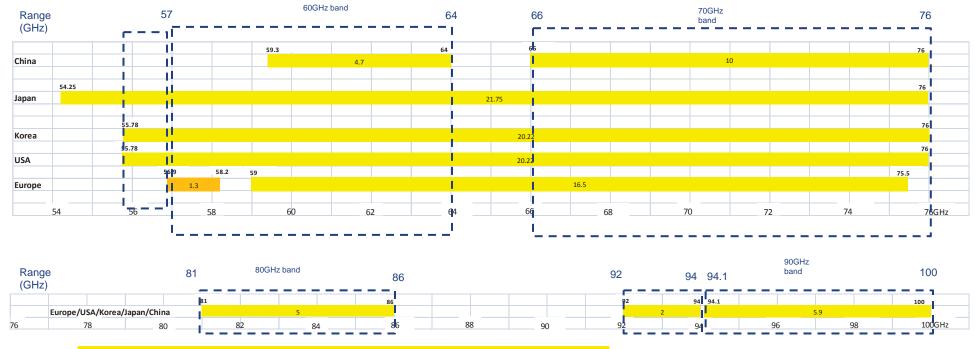

High rank MIMO (SU/MIMO) and CA, Interference Management schemes for system BW < 400 MHz & Spectrum Sharing among operators

Low rank MIMO for system BW in excess of 1 GHz with no interference management schemes

Low rank MIMO for system BW in excess of 1 GHz with no interference management schemes & Spectrum Sharing among operators

54-100GHz, Co-Primary Mobile Allocation, min. 300MHz Contiguous Spectrum

Low rank MIMO for system BW in excess of 1 GHz with no interference management schemes

Low rank MIMO for system BW in excess of 1 GHz with no interference management schemes & Spectrum Sharing among operators
